### Applications

Monitoring of speed or standstill also during setup operation

### Indication

Standstill monitoring:

1. green LED: on, when supply voltage connected
2. green LED: on, when standstill detected on channel 1
3. green LED: on, when standstill detected on channel 2

Overspeed monitoring:

1. green LED: on, when supply voltage connected
2. green LED: on, when no overspeed detected on channel 1
3. green LED: on, when no overspeed detected on channel 2

### Block Diagram

### Circuit Diagram

The device can be used for standstill and speed monitoring. All units have 2 sensing channels.

**Variants**

Three main variants are available:  
 BH 5932.22/\_ \_0: Devices with fixed tripping value  
 BH 5932.22/\_ \_2: Devices with separate adjustment for both channels  
 BH 5932.22/\_ \_1: Devices with common adjustment for both channels  
 BH 5932.22/\_ \_3: Devices with common adjustment for both channels and fine tuning to synchronise both channels

**Setting ranges**

On adjustable units the total range is split up in 4 sub ranges that can be selected with 2 DIP-switches per channel. To adjust the setting value in the selected range the potentiometers are used.

**Adjustment of setting range**

The number of pulses [lpm] to be adjusted can be calculated using the following formula:

$$\text{Rpm} \times \text{number of sensing spots} = \text{lpm}$$

e.g. 7.5 Rpm x 2 sensing spots = 15 lpm

**Operation as standstill monitor**

Both channels must be adjusted so that they switch simultaneously. The maximum time after standstill detection until switching of the output relays is depending on the adjusted lpm value. This delay can be calculated as follows:

$$\frac{60 \text{ s}}{\text{adjusted lpm-value}} + 2.5 \text{ s} = t_{vs}$$

$t_{vs}$  = operate delay after standstill detection

e.g. at a setting of 15 lpm

$$\frac{60 \text{ s}}{15} + 2.5 \text{ s} = 6.5 \text{ s}$$

**Operation as overspeed monitor**

Especially on overspeed monitoring it is necessary to adjust both channels precisely on simultaneous switching. If the two channels switch not at the same time the disconnection of the drive is only made with the faster channel. The speed can drop immediately so that the slower channel does not detect overspeed and remains switched on. A new start is then disabled and the relay does not switch on again. A restart is only possible by disconnecting the power supply. To achieve an accurate setting the lpm setting value should be in the middle part of the setting range. The adjustment of simultaneous switching is easier on units with separate setting for each channel as on units with fine tuning potentiometer.

**Proximity sensors**

For safe operation the proximity sensors should be mounted vibration free. The position of the sensors should be chosen in a way that both sensors are operated simultaneously. Care must be taken that the sensors do not influence each other. The connection of the sensors to the supply is monitored. If there is an interruption in the sensor supply the corresponding output relay cannot be switched on, or if it is already on, it will switch off immediately. To achieve a fault free operation, the sensor must have draw at least 3 mA in off state. If sensors with lower consumption are used only devices without sensor detection can be operated. According to EN ISO 13849-1, the sensors must be checked for correct function in reasonable time intervals.

**Feedback circuit, reset, LEDs and timing**

The reset circuit X1 - X2 must be closed before connecting the power supply. The unit is ready for operation after typically 1.5 sec after the supply is connected.

The LEDs channel 1 and channel 2 are on when the corresponding relay is energized. The output contacts of the relays will only be activated if both input channels reach the enabling condition within a time span of approx. 2 sec. If the response value is not reached on both channels within this time, e.g. because of a defective sensor or because the sensors do not simultaneously switch the output contacts are not enabled.

Model with separate adjustable channels
